AI Chat History

Software Engineering Lab 4 — VibeCoding | Target Aim Trainer

Transcript-style record of selected exchanges. This is a formatted reconstruction from the conversation available in this chat, not a verbatim platform export. It includes selected user messages and faithful summaries of assistant guidance; it does not include Antigravity's separate conversation.

1. Understanding the assignment

USER

“this is se project all things i have sent u help me do it”

CHATGPT

I identified this as Software Engineering Lab 4 — VibeCoding and reviewed the handout. The handout asks you to run the assigned Python game, record 10 seconds before changes, use AI prompts to fix bugs and add README features, record another 10 seconds after changes, push the updated code to your personal repository, and submit both videos, updated code, and chat history in the Lab-4 folder. It says not to raise a pull request to SETAPESU26.

USER

“what should i do” / “now what”

CHATGPT

I guided you through extracting the assigned ZIP, opening the project folder, and checking README.md before running or editing code.

2. Running the original game

USER

“wheel for pygame … fatal error: 'SDL.h' file not found”

CHATGPT

The install error indicated pip was trying to compile Pygame from source with Python 3.14 and could not find the SDL header. I recommended using Python 3.12 in a separate virtual environment rather than changing your system Python.

USER

“its working only ig”

CHATGPT

I confirmed the game window was open and asked you to record the original gameplay before modifying files. I also explained that the starting HUD values were normal and that the bugs needed to be tested.

USER

“bro whats wrong is this tell me first”

CHATGPT

I outlined the four README tasks: collision accuracy, a game-over screen showing final score and accuracy, replay with Easy/Medium/Hard or exit, and sound effects for hits, misses/timeouts, and round end.

3. Recording videos

USER
“bro how do we record ? secreen recod in mac m4”

CHATGPT
I explained that Shift + Command + 5 opens the macOS screen-recording toolbar. You can record the whole screen or a selected portion, then stop recording from the menu bar.

USER
“check this”

CHATGPT
I reviewed the recording you shared. It showed gameplay and the timer reaching zero, but it did not clearly demonstrate the collision bug or the game-over/replay screen.

USER
“cant we show sound in screen recording”

CHATGPT
Yes. The built-in recorder can capture sound through the microphone if selected, though speaker playback may be inconsistent. OBS with an appropriate system-audio capture source is another option.

4. Working with Antigravity

USER
“i opened it in my antif=gravity now what”

CHATGPT
I suggested using Antigravity to inspect the target and game-engine files and to work one task at a time. For Task 1, I provided a prompt asking it to investigate the difference between the drawn target radius and the hit-test radius, implement the smallest fix, list changed files, and explain how to test it.

USER
“after each change i should push to git?”

CHATGPT
I recommended testing each task, then making a separate Git commit and pushing to your personal repository. Before pushing, check that the remote is your personal repository, not SETAPESU26.

5. Submission requirements

USER
“what we need to submit”

CHATGPT
The handout's deliverables are: (a) before and after videos, (b) updated code, and (c) chat history exported as a document/PDF, placed in the Lab-4 folder of your lab repository.

USER
“i need to submit here so what idhar”

CHATGPT

For the Teams assignment, I recommended attaching the before video, after video, a ZIP of the updated project (excluding virtual environments), and the chat-history PDF, then checking all attachments before clicking Turn in.

USER

“chat_history.pdf too. how this and i just told antigravity to do should i snd no”

CHATGPT

I explained how to save a PDF of this ChatGPT conversation using Command + P → Save as PDF, and noted that Antigravity's actual conversation may also need to be included if the TA expects the complete history from every AI tool.

6. Features to verify before submission

USER

“### Task 1: Refine Collision Detection … ### Task 4: Add Sound Feedback”

CHATGPT

The four required features are: (1) clickable area matches the visible target circle as it shrinks; (2) a game-over screen displays final score and accuracy and waits for input; (3) replay with Easy, Medium, Hard target lifespan/size or exit; (4) sound effects for hit, miss including timeout, and round end.

CHATGPT

Before submitting, test all four features, save the updated files, create the updated project ZIP, and ensure the before/after videos and chat-history PDF are attached. This document does not verify that the code changes were implemented successfully.

End of selected transcript-style record.
